

# I1 Smart Fabric

## PRODUCT DESCRIPTION:

I1 Smart Fabric protects the interior from just about anything life throws at it including stain producers such as coffee, wine, soda, blood, and other family favorites. Unlike other commercial solutions, the nano particles of I1 coat the individual fibers of the fabric, leaving the “breathability” and feel of the fabric unaffected. Stale air is allowed to escape from the fabric keeping it fresh; however at the same time water or oil-based liquids are instantly repelled from the surface. I1 outlasts conventional water repellent coatings by a factor of 5 and has superior durability on soft-tops, fabric and textile seats, carpets, etc. Recommended use on convertible tops, textile seats and carpet mats, and outdoor furniture shoes, and clothing.

## OTHER EQUIPMENT/PRODUCTS RECOMMENDED FOR USE:

- detailing brushes
- clean, high quality microfiber towels
- GTechniq W2 All Purpose Cleaner

## PRIOR TO USE:

- All cloth to be treated should be properly cleaned and dry.
- C6 Matte Dash, L1 Leather Guard and most of interior detail work should be completed.

## RECOMMENDED USE:

- All cloth floor mats, seats and interior carpet

## APPLICATION INSTRUCTIONS:

-Floor mats: With the trigger about 4–6 inches away from the floor mat, apply I1 liberally to entire area to be coated. Once this has been done, take a detailing brush and lightly brush the area to separate the fibers and help the I1 work its way deep into the nap of the carpet. No need to scrub, just very light strokes. Go back again and apply another thin layer of I1 to the area. Repeat this process on all floor mats/removable fabric panels. Let treated areas air out for at least a half hour and then repeat this process 2–3 times for maximum protection.

-Interior Carpet: Using caution to avoid plastic and leather, repeat process described above.

- Cloth Seats: With the trigger about 12 inches away from the section of the seat you are working on, apply I1 liberally to entire area to be coated. Once this has been done, lightly mist a clean, high quality microfiber towel and lightly rub the towel across the section being treated. Go back again and apply another thin layer of I1 to the area. Repeat this process on all cloth seats. Let treated areas air out for at least a half hour and then repeat this process.

**NOTE:** Since the carrier for the actual fabric coating in I1 is alcohol there will be a very strong rubbing alcohol smell that will linger in the car if it is not given time to air out. Make sure the car is given ample time to air out before the time of delivery. If this is not possible, make sure the customer is aware of it before getting into the car and inform them that it will go away.

**NOTE:** Unlike most fabric protectors that are on the market, I1 Smart Fabric does not form a coat ON TOP of the carpet fibers themselves. What is happening is that the carrier is taking the product and allowing the individual fibers to reach a saturation point. The alcohol then evaporates leaving the coating itself in the individual fibers. This seals the fibers so they can not absorb any other liquid, and allows the fabric to breath and retain its softness. Some liquid will still be able to get between the fibers themselves because of this. Make sure your customers are aware that the product is not magic. Spilled coffee needs to be cleaned up. It just won't stain.

**CURE TIME:** Allow 6 hours before exposing to water.
